1) INTRODUCTION

1.1) Overview

To Detect and recognize the plant diseases and to recommend fertilizer, it is necessary to provide symptoms in identifying the disease at its earliest. Hence the authors proposed and implemented new fertilizers Recommendation System for crop disease prediction. Two datasets, the fruit dataset and the vegetable dataset, are gathered for this project. Convolutional Neural Networks (CNN), a deep learning neural network, are used to train and evaluate the collected datasets. CNN is used to first train and then test the fruit dataset. There are six classes, and each one has been trained and tested. Second, the training and testing of the vegetable dataset take place. The product utilized for preparing and testing of datasets is Python. After being written in the Jupyter notebook that comes with Anaconda Python, all of the Python codes are tested in the IBM cloud. Finally, with the assistance of the Python library Flask, a web-based framework is created. Two HTML files, as well as the static folder files that are associated with them, are created in the templates folder. Spyder-Anaconda Python is used to write and test the Python program "app.py" that connects to these two websites.

1.2) Purpose

Agriculture is the main aspect of country development. Many people lead their life from agriculture field, which gives fully related to agricultural products. Plant disease, especially on leaves, is one of the major factors of reductions in both quality and quantity of the food crops. In agricultural aspects, if the plant is affected by leaf disease, then it reduces the growth of the agricultural level. Finding the leaf disease is an important role of agriculture preservation. After pre-processing using a median filter, segmentation is done by Guided Active Contour method and finally, the leaf disease is identified by using Support Vector Machine. The disease-based similarity measure is used for fertilizer recommendation.

2) LITERATURE SURVEY

2.1) Existing problems

Indumathi proposed a method for leaf disease detection and suggest fertilizers to cure leaf diseases. But the method involves less number of train and test sets which results in poor accuracy. Pandi selvi proposed a simple prediction method for soil based fertilizer recommendation system for predicted crop diseases. This method gives less accuracy and prediction.

2.2) References

1. R Indumathi.; N Saagari.; V Thejuswini.; R Swarnareka., " Leaf Disease Detection and Fertilizer Suggestion", IEEE International Conference on System, Computatio -n, References.

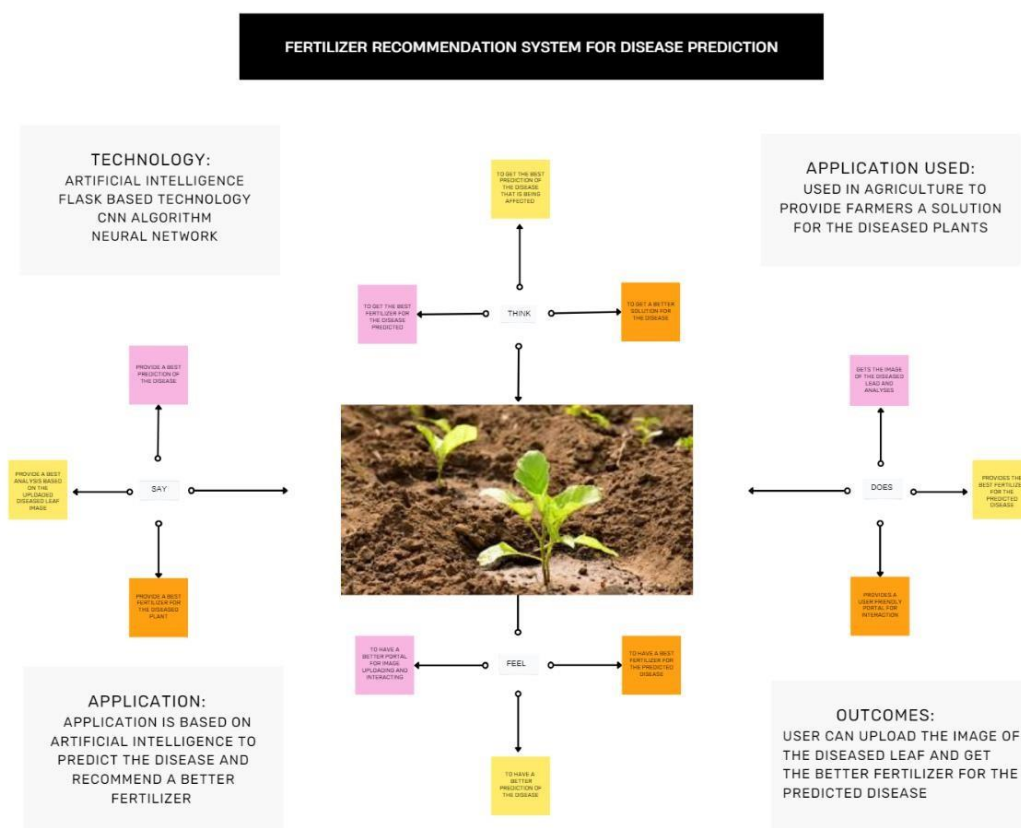

2. P. Pandi Selvi, P. Poornima, "Soil Based Fertilizer Recommendation System for Crop Disease Prediction System", International Journal of Engineering Trends and Applications (IJETA) – Volume 8 Issue 2, Mar-Apr 2021.

2.3) Problem Statement Definition

The most significant sector in modern life is agriculture. A wide range of bacterial and fungal diseases affect most plants. Plant diseases hampered production significantly and posed a significant threat to food security. As a result, in order to guarantee maximum quantity and quality, plant diseases must be identified promptly and accurately. The variety of pathogen varieties, shifts in cultivation practices, and inadequate plant protection methods have all contributed to an increase in the number and severity of plant diseases in recent years. By examining the symptoms that are displayed on the leaves of the plant, an automated system is introduced to identify various plant diseases.

3) IDEATION & PROPOSED SOLUTION

3.1) Empathy map canvas

3.2) Ideation and Brainstorming

Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

- 10 minutes to prepare
- 30 minutes to brainstorm
- 30 minutes to prioritize

Before you collaborate

A little bit of preparation goes a long way when it comes to brainstorming. Here's what you need to do to get going.

- 1. Name gathering: Gather names that participate in the session and list them in a circle. (Name: Name, Position: Position, or Position: Name)
- 2. Set the goal: Make sure that everyone's clear on the goal of the session and the problem you're trying to solve.
- 3. Learn how to use the facilitation tools: Learn how to use the facilitation tools. (Learn how to use the facilitation tools. Learn how to use the facilitation tools. Learn how to use the facilitation tools.)

Define your problem statement

What problem are you trying to solve? Define your problem in a way that is clear, concise, and measurable. This will be the focus of your brainstorming.

How might we better understand the problem?

- 1. Why is this a problem? (Why is this a problem? Why is this a problem? Why is this a problem?)
- 2. What are the symptoms? (What are the symptoms? What are the symptoms? What are the symptoms?)
- 3. What are the causes? (What are the causes? What are the causes? What are the causes?)
- 4. What are the consequences? (What are the consequences? What are the consequences? What are the consequences?)

Brainstorm

Write down any ideas that come to mind. Don't worry about whether they are good or bad. Just get them out of your head.

10 minutes

Lakshmi vidhya

Avoid unwanted fertilizer	It allows farmers to buy fertilizers for their applications itself
Easy to identify the disease	Avoid unwanted chemical

Devdharshini

Instructions in correct way	usage period of the fertilizers is mentioned
low maintenance for the farmer	userfriendly

Gayathiri

farmers can cultivate crop without hurdle	farmers may avoid soil pollution
It detects disease and suggest better solution	It also tells the farming techniques to the farmers

Dheepana

disease identification	prior knowledge about the disease
suggestion of correct fertilizers	good quality of fertilizers

Group Ideas

Take a few minutes to group ideas. Cluster similar ideas together. Then, select the ideas that you think are the most important. (You can also select ideas that you think are the most interesting or the most creative.)

10 minutes

It also tells the farming techniques to the farmer	farmers can easily avoid soil pollution	farmer can easily identify the disease
Easy to understand User Interface	Farmer can use correct fertilizer	Avoid financial loss

Prioritize

Write down the ideas that you think are the most important. Then, select the ideas that you think are the most important. (You can also select ideas that you think are the most interesting or the most creative.)

10 minutes

Importance

Feasibility

good quality fertilizer

It allows farmers to buy fertilizers for their applications itself

It detects disease and suggest correct treatment

After you collaborate

Now that you have a list of ideas, it's time to select the ideas that you think are the most important. (You can also select ideas that you think are the most interesting or the most creative.)

10 minutes

Quick actions

- 1. Share the results: Share a few ideas with the group and ask for feedback. (You can also share ideas that you think are the most interesting or the most creative.)
- 2. Select the ideas: Select the ideas that you think are the most important. (You can also select ideas that you think are the most interesting or the most creative.)

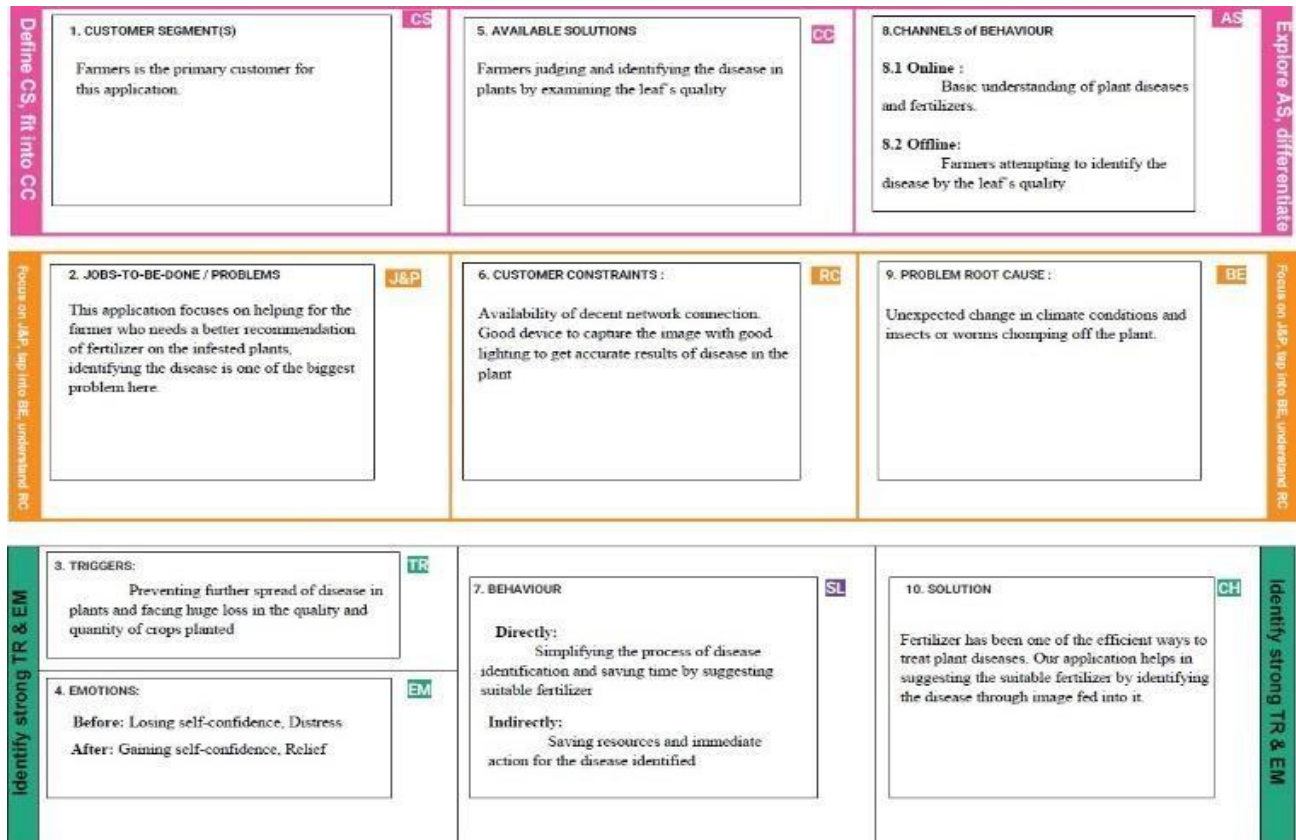

Keep moving forward!

- 1. Share the results: Share a few ideas with the group and ask for feedback. (You can also share ideas that you think are the most interesting or the most creative.)
- 2. Select the ideas: Select the ideas that you think are the most important. (You can also select ideas that you think are the most interesting or the most creative.)

3.3) Proposed Solution

A deep learning-based neural network is used to train and test the collected datasets in this project. CNN, a neural network based on deep learning, achieves classification accuracy of more than 90%. The accuracy rate can be increased to 95% to 98% by increasing the number of dense layers and modifying hyper parameters like batch size and number of epoch.

3.4) Problem solution fit

4) REQUIREMENT ANALYSIS

4.1) Functional Requirements

Following are the functional requirements of the proposed solution

FR.No	Functional Requirements	Sub Requirements
FR-1	User Registration	<ul style="list-style-type: none"> Registration through Form Registration through Gmail Registration through LinkedIn
FR-2	User Confirmation	<ul style="list-style-type: none"> Confirmation via OTP Confirmation via Email
FR-3	Capturing Image	Capture the image of the leaf and the parameter of the captured image.
FR-4	Image Processing	Upload the image for the prediction of the disease in the leaf.
FR-5	Leaf Identification	Identify the leaf and predict the disease in the leaf.

FR-6	Image Description	Suggesting the best fertilizer for the disease.
------	-------------------	---

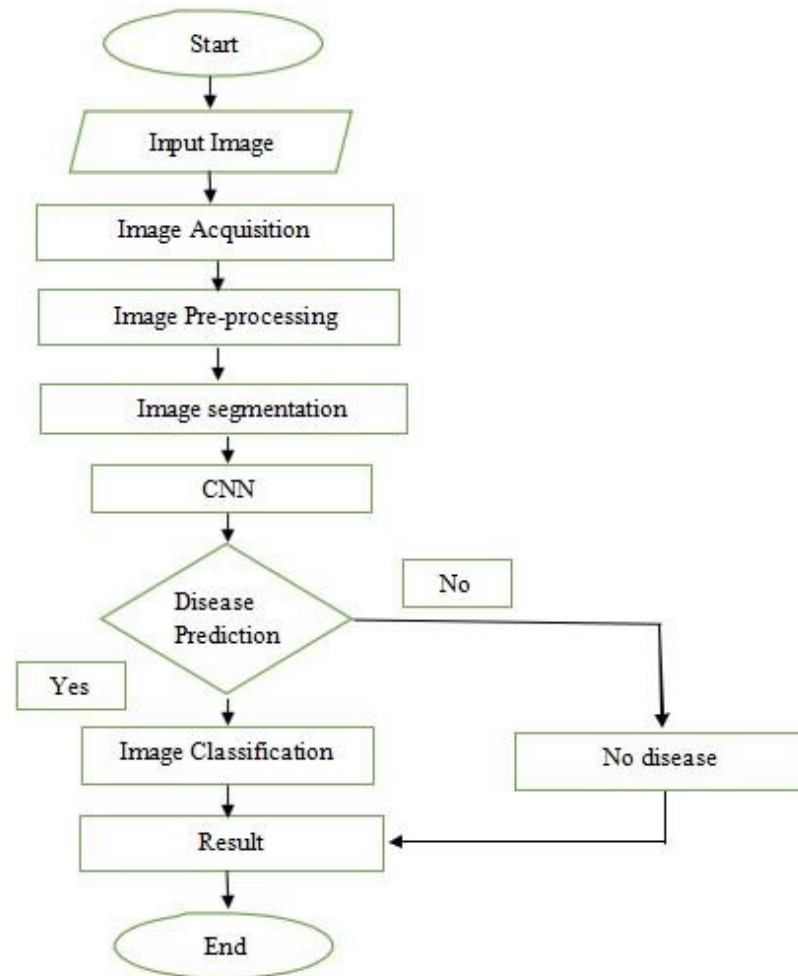

4.2 Non Functional Requirements

Following are the non-functional requirements of the proposed solution.

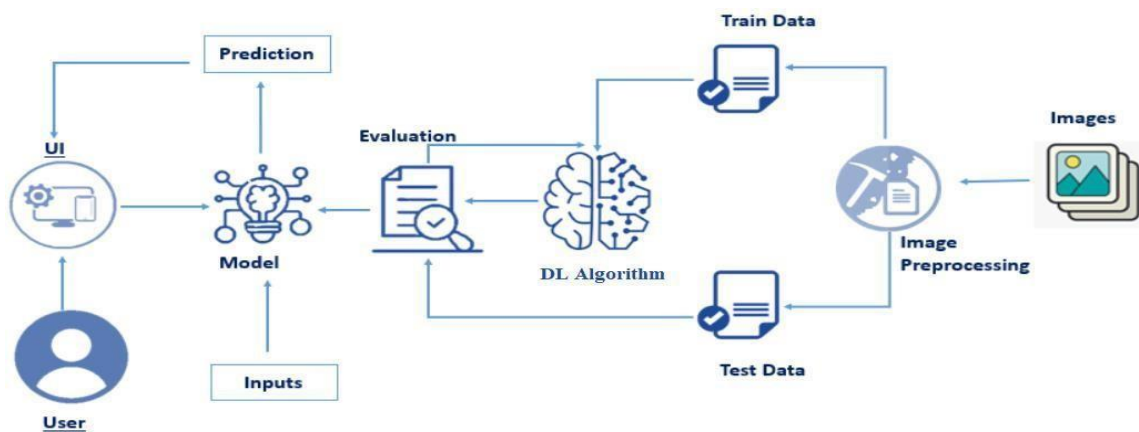

NFr.no	Non-Functional Requirement	Description
Nfr-1	Usability	Datasets of all the leaves are used to detect the disease that is present in the leaf.
Nfr-2	Security	The information belongs to the user and leaves are secured highly.
Nfr-3	Reliability	The leaf quality is important for predicting the disease in the leaf.
Nfr-4	Performance	The performance is based on the quality of the leaf used for disease prediction
Nfr-5	Availability	It is available for all users to predict the disease in the plant
Nfr-6	Scalability	Increasing the prediction of the disease in the leaf

5) PROJECT DESIGN

5.1) Data Flow Diagram

5.2 Solution & Technical Architecture

5.3 User Stories

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer (Mobile user)	Login	USN-1	As a user, I can log into the application by entering my email & password	I can access the UI and obtain the necessary results	Medium	Sprint-1
	Interactive UI	USN-2	As a user, I can easily understand and use the application	I can access the UI and obtain the necessary results	High	Sprint-1
	Fruit Disease	USN-3	As a user, I can separately upload the image for fruit disease prediction	I can upload and access the application through a separate UI	High	Sprint-2
	Vegetable Disease	USN-4	As a user, I can separately upload the image for vegetable disease prediction	I can upload and access the application through a separate UI	High	Sprint-2
	Logout	USN-5	As a user, I can log out of the application	I can end my session in the application by logging off	Medium	Sprint-1

6) PROJECT PLANNING & SCHEDULING

6.1 Sprint Planning & Estimation

Sprint	Functional Requirement	User story Number	User Story/ Task	Story Points	Priority	Team Members
Sprint 1	Image processing		Process the images for model training	2	High	<ul style="list-style-type: none"> • Devdharshini • Dheepana • Gayathiri • G.Lakshmi Vidhya

	Data Collection		Gather the data set from kaggle	2	High	<ul style="list-style-type: none"> • Devdharshini • Dheepana • Gayathiri • G.Lakshmi Vidhya
--	-----------------	--	---------------------------------	---	------	---

Sprint	Functional Requirement	User story Number	User Story/ Task	Story Point	Priory	Team Members
Sprint-2	model building and training(fruit)		Create a model which can classify diseased fruit	8	High	<ul style="list-style-type: none"> • Devdharshini • Dheepana • Gayathiri
			plants from given images.			<ul style="list-style-type: none"> • G.Lakshmi Vidhya
	Model building and training(Vegetable)		Create a model which can classify diseased vegetable plants from given images.	8	High	<ul style="list-style-type: none"> • Devdharshini • Dheepana • Gayathiri • G.Lakshmi Vidhya

Sprint	Functional Requirement	User story Number	User Story/ Task	Story Points	Priority	Team Members
sprint-3	Testing the model (Fruit)		Test the Fruit model built and train it on IBM Cloud	8	High	<ul style="list-style-type: none"> • Devdharshini • Dheepana • Gayathiri • G.Lakshmi Vidhya
	Testing the model (Vegetable)		Test the Vegetable model built and Train it on IBM Cloud	8	High	<ul style="list-style-type: none"> • Devdharshini • Dheepana • Gayathiri • G.Lakshmi Vidhya

Sprint	Functional Requirement	User story Number	User Story/ Task	Story Points	Priority	Team Members
Sprint -4	Application Building		Develop the Web pages. Home.html and predict.html	8	High	<ul style="list-style-type: none"> • Devdharshini • Dheepana • Gayathiri • G.Lakshmi Vidhya

	Flask Application		Integrate the HTML pages with Flask and build web application	8	High	<ul style="list-style-type: none"> • Devdharshini • Dheepana • Gayathiri • G.Lakshmi Vidhya
--	-------------------	--	---	---	------	---

6.2 Sprint Delivery Schedule

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Sprint Release Date (Actual)
Sprint-1	10	6 Days	24 Oct 2022	29 Oct 2022	30 Oct 2022
Sprint-2	15	6 Days	31 Oct 2022	05 Nov 2022	06 Nov 2022
Sprint-3	15	6 Days	07 Nov 2022	12 Nov 2022	13 Nov 2022
Sprint-4	12	6 Days	14 Nov 2022	19 Nov 2022	20 Nov 2022

6.3 Reports from JIRA

The screenshot shows the Jira Software interface for a project named 'Fertilizer Recommendation System'. The left sidebar contains navigation options like Roadmap, Backlog, Board, Code, Project pages, Add shortcut, and Project settings. The main area displays a sprint board with three columns: 'TO DO', 'IN PROGRESS', and 'DONE 4 ISSUES'. The 'DONE' column lists four tasks: 'Image Processing' (FRS-3), 'Model building (Fruit and Vegetable)' (FRS-4), 'Testing and Deploying the models on IBM Cloud' (FRS-5), and 'Application Building' (FRS-6). The sprint is currently 0 days remaining and is marked as 'Complete sprint'.

7) CODING & SOLUTIONING

7.1) Feature-1

The fruit,vegetable disease prediction is developed using the CNN algorithm to predict the diseases. The model is trained over six classes and 5384 images and is tested over six classes with 1686 images to get better accuracy. We added a single convolution layer and max pooling with size 2 for better accuracy more convolution layers can be added, with higher max pooling. Then the model is trained over two epochs, this can be increased for better accuracy rates.

```

In [5]: from tensorflow.keras.preprocessing.image import ImageDataGenerator
train_datagen=ImageDataGenerator(rescale=1./255, shear_range=0.2, zoom_range=0.2, horizontal_flip=True)
test_datagen=ImageDataGenerator(rescale=1)
x_train=train_datagen.flow_from_directory(r'C:\Users\krishna\OneDrive\Desktop\Fertilizer recommendation system for disease prediction\train')
x_test=test_datagen.flow_from_directory(r'C:\Users\krishna\OneDrive\Desktop\Fertilizer recommendation system for disease prediction\test')

Found 5384 images belonging to 6 classes.
Found 1686 images belonging to 6 classes.

In [6]: from tensorflow.keras.models import Sequential
from tensorflow.keras.layers import Dense, Convolution2D, MaxPooling2D, Flatten

In [7]: model=Sequential()
model.add(Convolution2D(32,(3,3),input_shape=(128,128,3),activation='relu'))
model.add(MaxPooling2D(pool_size=(2,2)))
model.add(Flatten())
model.summary()

```

7.2) Feature 2

The models are then deployed on IBM Cloud deployment space and are trained using IBM machine learning services. The trained models are downloaded and tested for application development.

Deploying the fruit and vegetable models in IBM Cloud.

Demonstration Screenshots :

10) ADVANTAGES AND DISADVANTAGES

List of Advantages

- The proposed model here produces lofty accuracy of classification.
- Considerable datasets can also be trained and tested.
Images of enormous can be resized within the proposed itself.

List of Disadvantages

- For training and testing, the proposed model requires sky-high computational time.
- The neural network architecture used in this project work has high complexity.

11) CONCLUSION

The image classification of vegetable and fruit datasets is the focus of the proposed model. During the testing and training of the model, the following observations are made:

- Increasing the number of epochs led to an increase in classification accuracy.
- Different classification accuracies are obtained for various batch sizes.
- The number of convolution layers increases the accuracy.
- Variable dense layers also improved classification accuracy.
- By altering the size of the kernel that is utilized in the output of the convolution layer, various accuracies can be achieved.

When the train and test datasets are different sizes, the accuracy varies.

12) FUTURE SCOPE

This project's proposed model can be used for image recognition. Using Python to Executable Software, the entire model can be converted to application software. The OpenCV python library makes it possible to classify, recognize, and process images in real time. This project's work can be expanded to include login and signup to increase the authenticity of users.

<div style="font-size:20px;font-family:Montserrat;padding-left:70px;paddingright:30px;text-align:justify;">Agriculture is one of the major sectors worls wide. Over the years it has developed and the use of new technologies and equipment replaced almost all the traditional methods of farming. The plant diseases effect the production. Identification of diseases and taking necessary precautions is all done through naked eye, which requires labour and laboratries. This application helps farmers in detecting the diseases by observing the spots on the leaves, which inturn saves effort and labor costs.</div><br><br>
